

Waste Disposal E-Commerce

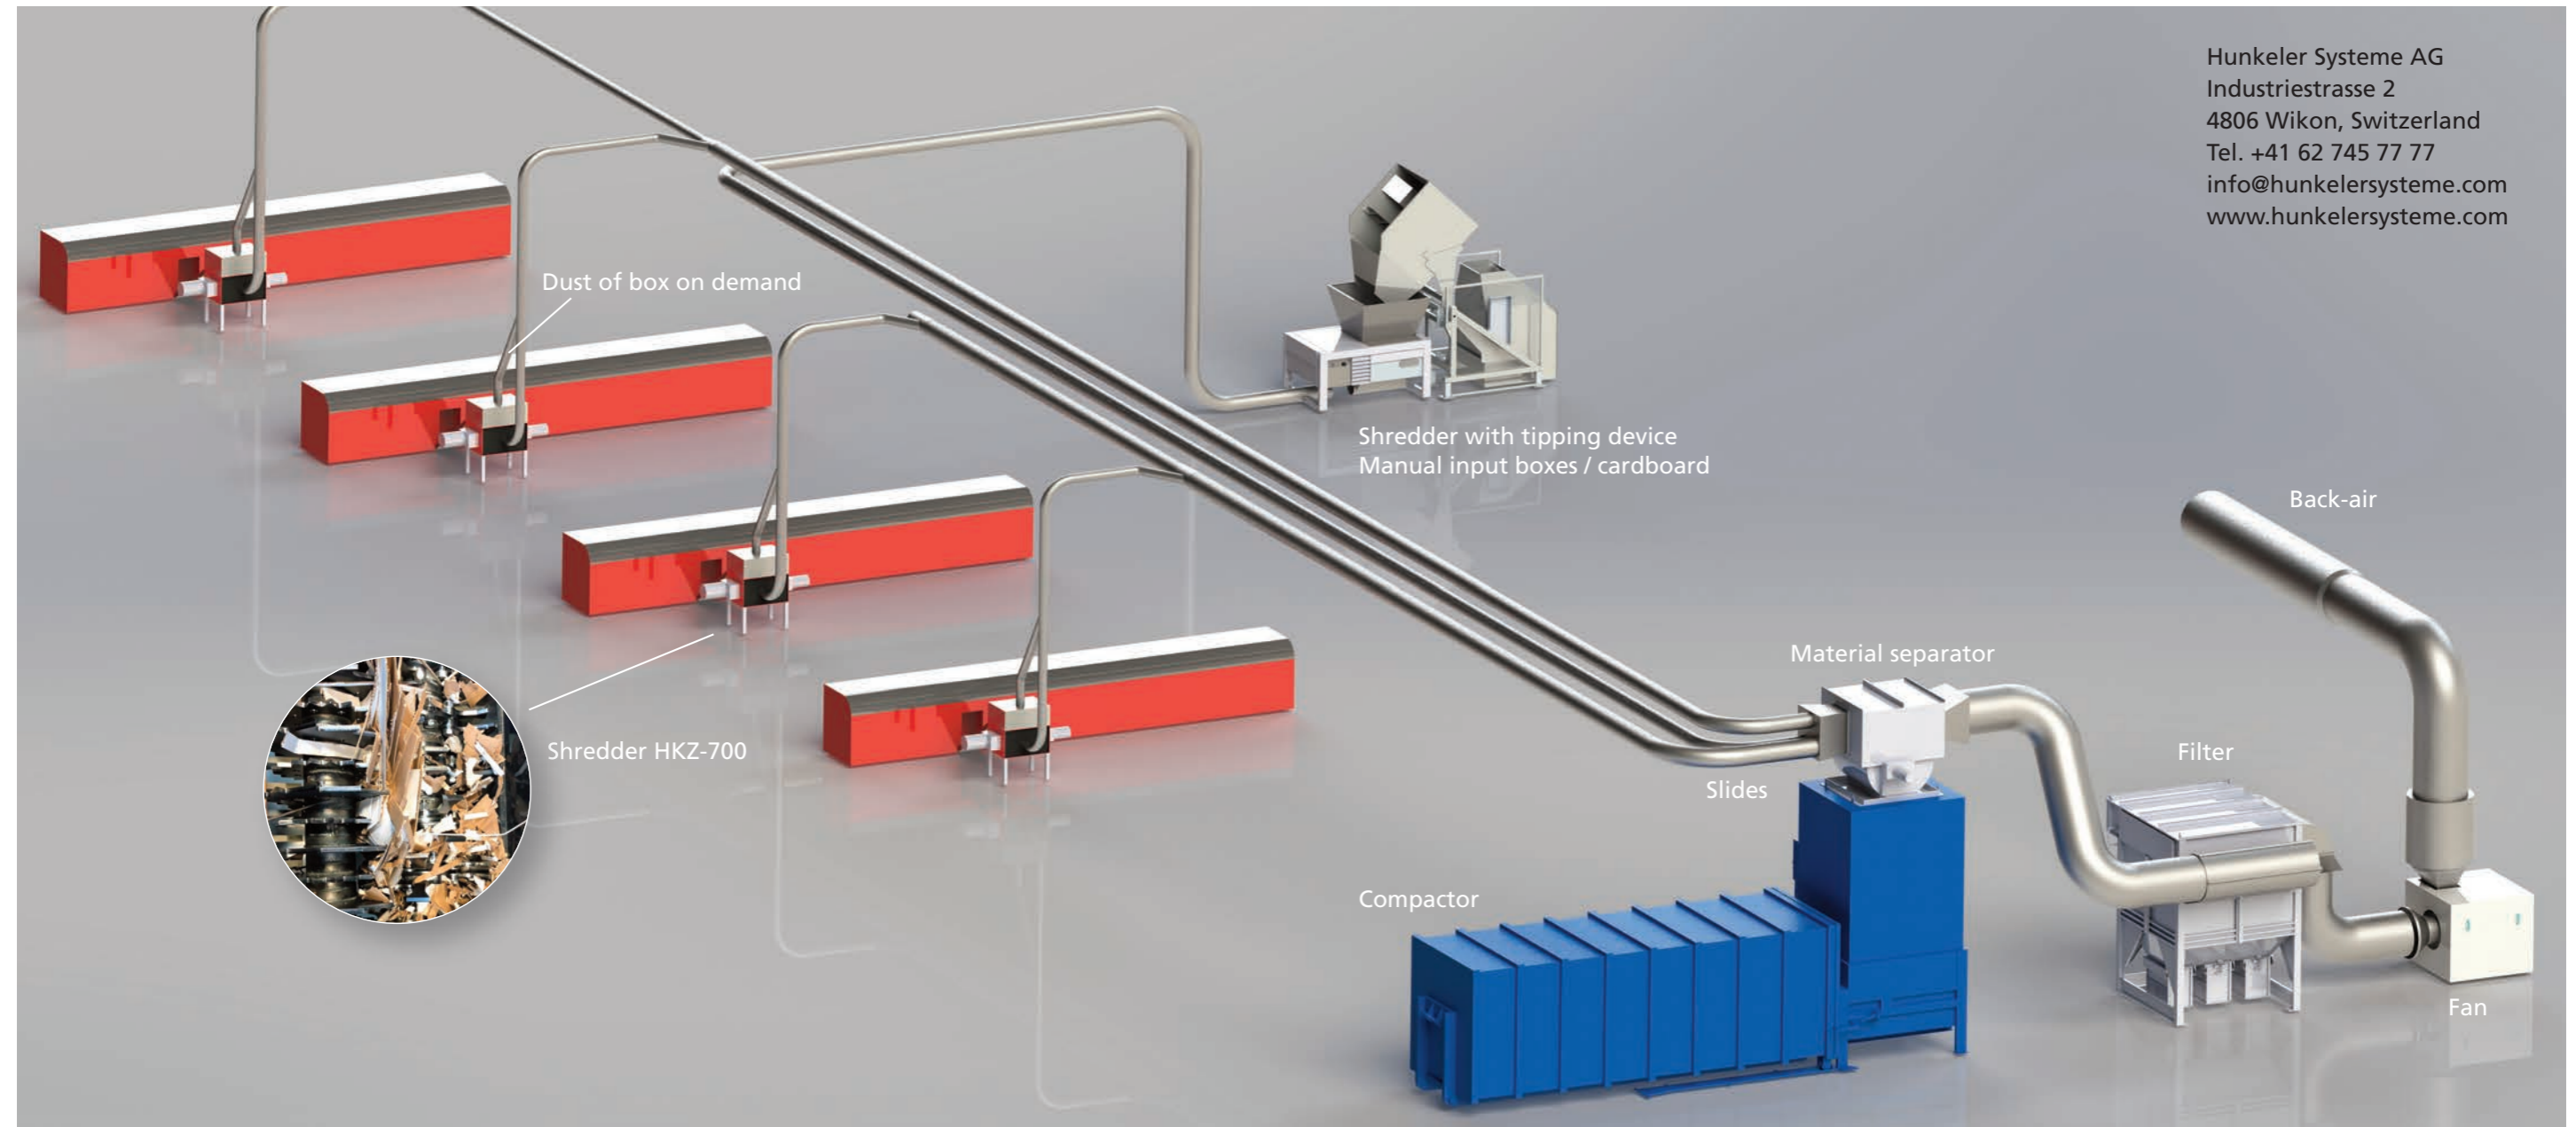

Production security and automatization of the E-Commerce systems

The suction system gathers the waste from the Box-On-Demand machines after it has been shredded by the HKZ 700 and turned into transportable particles. The resultant dust, generated by the cutting and folding processes, is also removed via the suction system. The waste material is conveyed via a closed duct system to the waste disposal centre and is compacted into a compactor or a baling compactor for transport and storage.

The dust-laden transport air is cleaned in the Jet-Filter and can be either exhausted outdoors or returned to the production rooms.

Advantages of Suction:

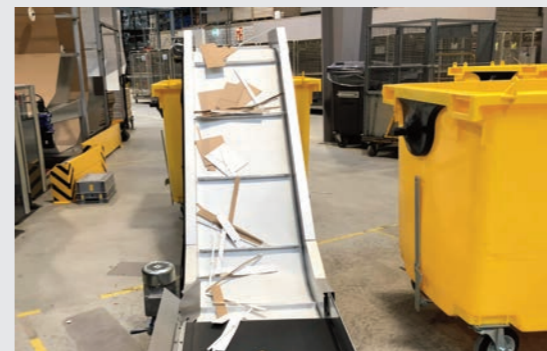

Reduction in labor cost

Less space is required

Cleaner production area

Nonstop production without container change

20-30% increased filling capacity of containers
